

WorkTime[®] Corporate – System Components

WorkTime Corporate consists of the following components:

- ❖ WorkTime Server
- ❖ WorkTime Administrator
- ❖ WorkTime Client
- ❖ Database

WorkTime Server receives monitoring data from WorkTime Client applications and saves it into the database. **WorkTime Server should be always running** either on a dedicated server or on any computer in your network. WorkTime Server can run as a process or as a service.

WorkTime Administrator is used to setup the whole system, to create WorkTime client installation and to generate reports (manually or by schedule).

WorkTime Client provides automatic invisible computer monitoring. **WorkTime Client runs on each computer to be monitored (on each employee computer or on each Terminal/Citrix server)** and is absolutely invisible to the user.

Database stores collected data. Supported databases are Firebird database (open-source) and MS SQL Server.
